

# THE ARCHITECTURE OF CLINICAL JUDGMENT

## How Rounding Structures Shape Medical Reality

BASED ON THE WORK OF WILLIAM AIRD

# Structure Is Not Neutral

Rounds are not just a way to visit patients; they are a way of organizing reality.

The structure privileges certain information and backgrounds others.

Over time, these logistics shape not only workflow but judgment itself.

# The Inversion of Discovery

## Historical Model (Discovery)

## Modern Model (Verification)

In modern consult practice, high-resolution data precedes the bedside. Before entering the room, the consultant already knows the CBC trends, smear description, Ferritin/LDH/INR, and unit location.

**Impact:** We no longer enter the room to discover the problem. We enter to test, humanize, or challenge a terrain we have already defined. The exam shifts from discovery to confirmation.

# The Terrain of Attention

## Computer-First vs. Bedside-First

### Bedside-First Rounds

#### ✓ Privilege

- Gestalt assessment
- Human connection / Trust
- Shared reality
- Detecting subtle instability

#### ⚠ Risk

- Underweighting silent trends
- Anchoring on appearance
- Delayed integration of trajectory

### Computer-First Rounds

#### ✓ Privilege

- Lab trends
- Temporal patterns
- Physiological trajectories
- Early signal detection

#### ⚠ Risk

- Distancing from context
- Overconfidence in numbers
- Missing discordant bedside clues

The danger is not choosing one style, but failing to recognize the blind spots of the one you choose.

# When Presentation Replaces Presence

**The Map**  
(Presentation)

A resident presents a polished, fluent case of a female patient. The narrative is perfect.

Upon entering the room, the team discovers the patient is male.

**The Territory**  
(Reality)

This was not dishonesty; it was structural drift. The presentation had become a surrogate for presence; the chart had become a proxy for reality.

**Key Insight:** In some structures, seeing the patient becomes optional. When the narrative is too polished, we risk mistaking the map for the territory.

# Expertise as a Filter

## The Student (Epistemology)

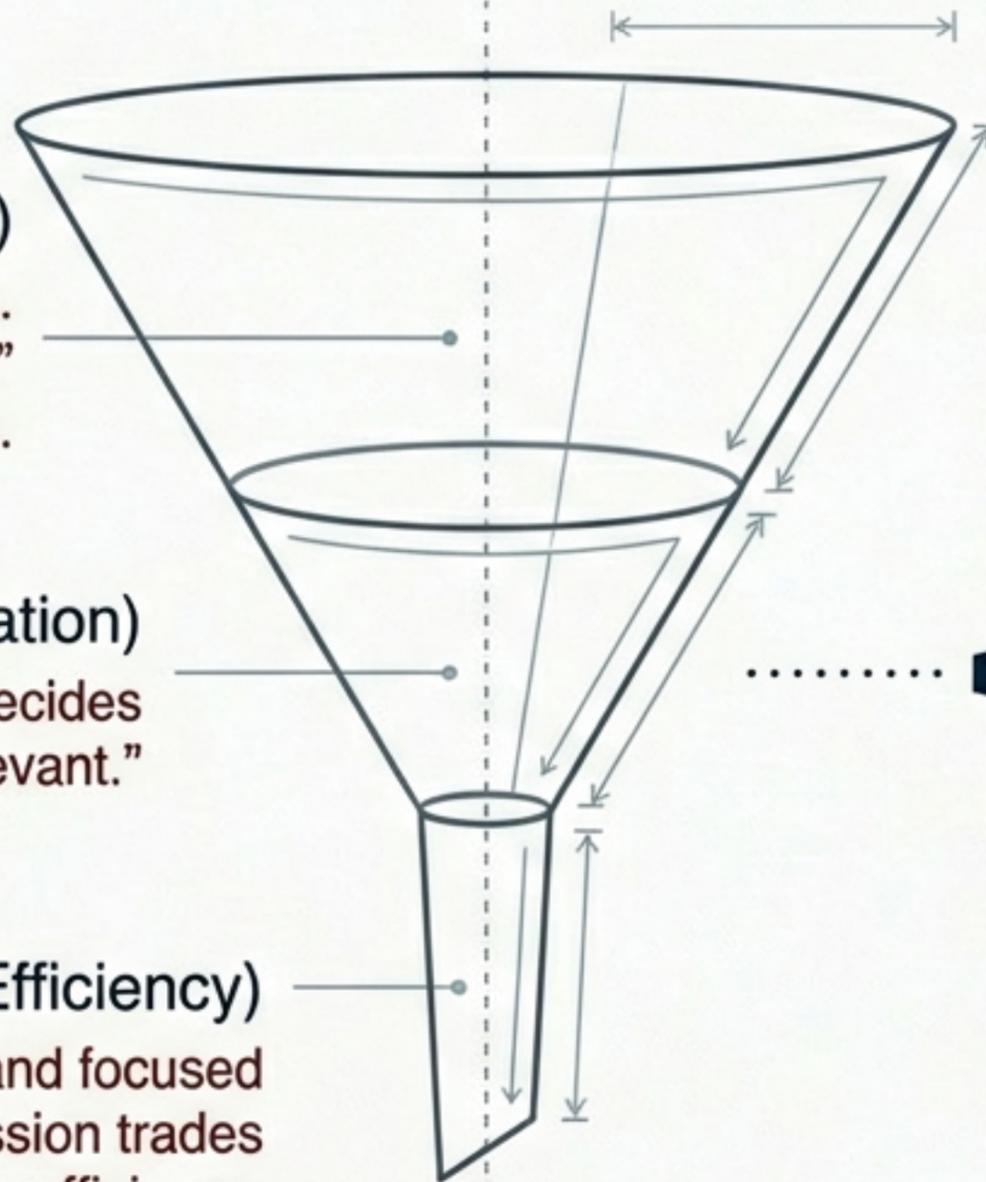

Presents full history & physical.  
Learning "what might matter."  
High breadth.

## The Resident (Prioritization)

Summarizes and filters. Decides  
what is "probably irrelevant."

## The Fellow (Efficiency)

Presents only key labs and focused  
assessment. Compression trades  
breadth for efficiency.

## The Paradox

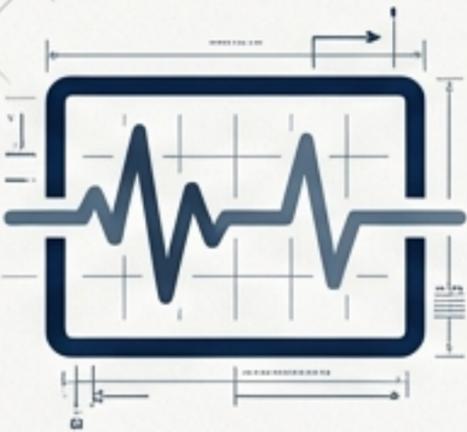

Expertise teaches you  
what to ignore to  
speed up Orientation.

But this compression  
narrows the field of  
possible signals.

What is filtered out is  
possibility.

# Geography as Cognitive Terrain

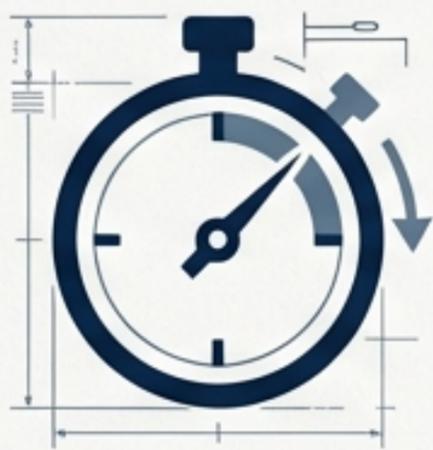

## The ICU

Data and trajectory dominate. Bedside exam is for stability, not discovery. Sedation and lines restrict the exam.

## The Ward

Appearance matters. Accessible patients allow history to shift the terrain.

## The ED

Tempo dominates. Uncertainty tolerance is low; Orientation is provisional.

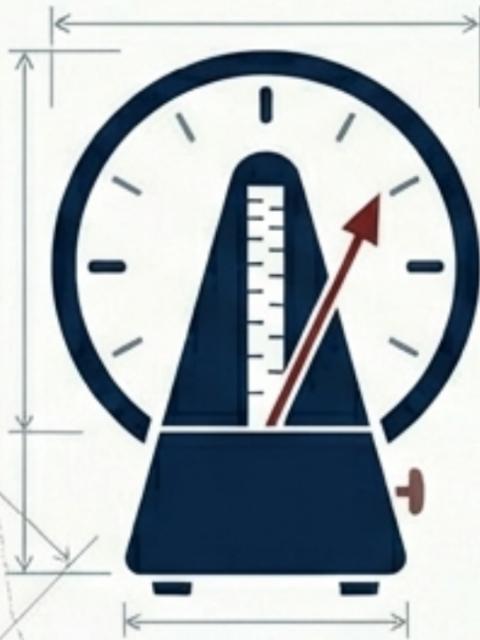

## Labor & Delivery

Access is restricted. Friction points delay presence.

These environments don't just change logistics; they change how judgment is formed.

# The Impact of Time and Barriers

## Time as a Force

**Rushed Rounds:** Favor closure, heuristics, and rapid synthesis.

**Unhurried Rounds:** Permit revision, second looks, and deliberation.

- **Insight:** Time pressure limits how much uncertainty can be tolerated.

## Physical Barriers (PPE)

**Impact:** Slows entry, limits team size, fragments shared observation.

- **Insight:** Discussion moves outside the room; the bedside becomes less central to collective perception.

# The Social Environment

How presence and hierarchy dictate safety.

## Family Presence

Changes the performance of confidence.

Trainees may suppress provisional thinking.

It alters what reasoning is 'socially safe' to display.

## Culture of Deference

### Canadian / Oral Exam Model

Adversarial but collaborative.  
Errors are tested.

### U.S. Deference Model

Polite acceptance.  
Errors go untested.

**Risk: Deference can quietly replace shared responsibility. A healthy culture requires permission to think independently in the presence of authority.**

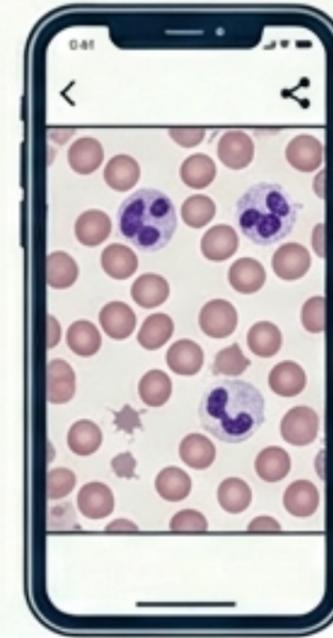

# Technology: The Redistributed Consult

## The Microscope

A site where **Orientation** is socially constructed.

Who drives the scope (Fellow vs. Attending) determines who frames the field and curates attention.

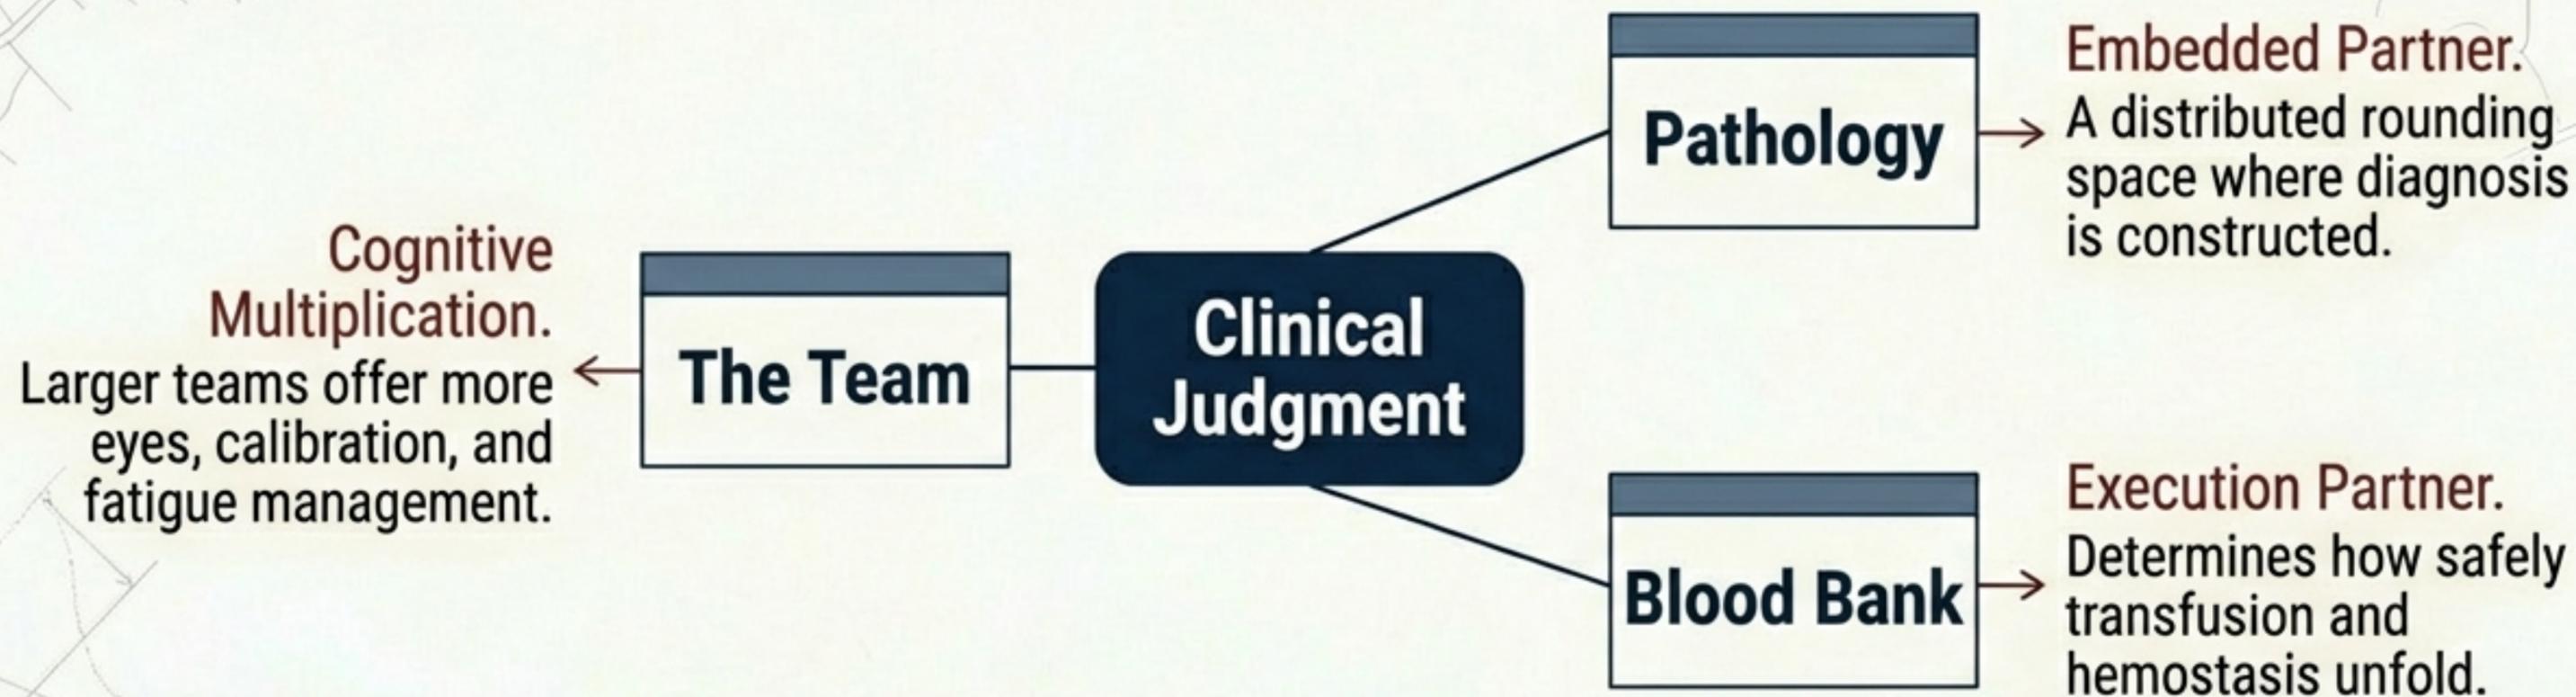

## The iPhone

**Diagnostic presence** becomes portable, but **contextual presence** recedes. We see the smear, not the patient.

- **Insight:** Technology redistributes clinical responsibility across distance and devices.

# Distributed Cognition

These are not ancillary services. They are parts of the "Extended Mind" of the medical team.

# The Borderlands

When the map doesn't match the territory.

**Hematology**

- Iliac Vein Thrombosis
- Massive PE
- Extensive Femoral Clot

**Vascular  
Medicine**

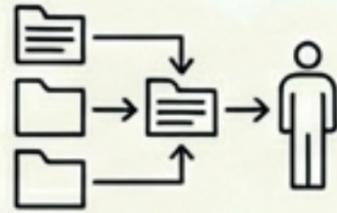

**The Problem: The clot has one physiology. The institution has two maps.**

- Duplicated data review
- Parallel risk stratification

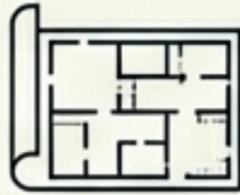

- Diffuse responsibility
- Ambiguous ownership of anticoagulation strategy

# The Invisible Architecture

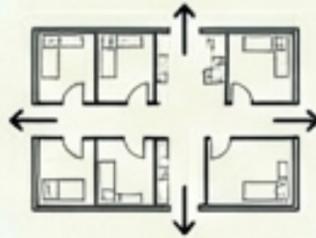

## A Synthesis of the Cognitive Operating System

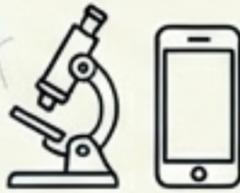

**Sequence** Does data precede the patient? (Inversion of Discovery)

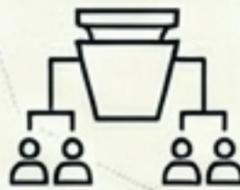

**Format** Does presentation replace presence? (Compression)

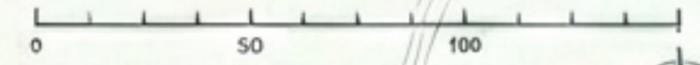

**Space** Does the unit dictate the thinking? (Geography)

**Tools** Does the tech redistribute presence? (Microscope/iPhone)

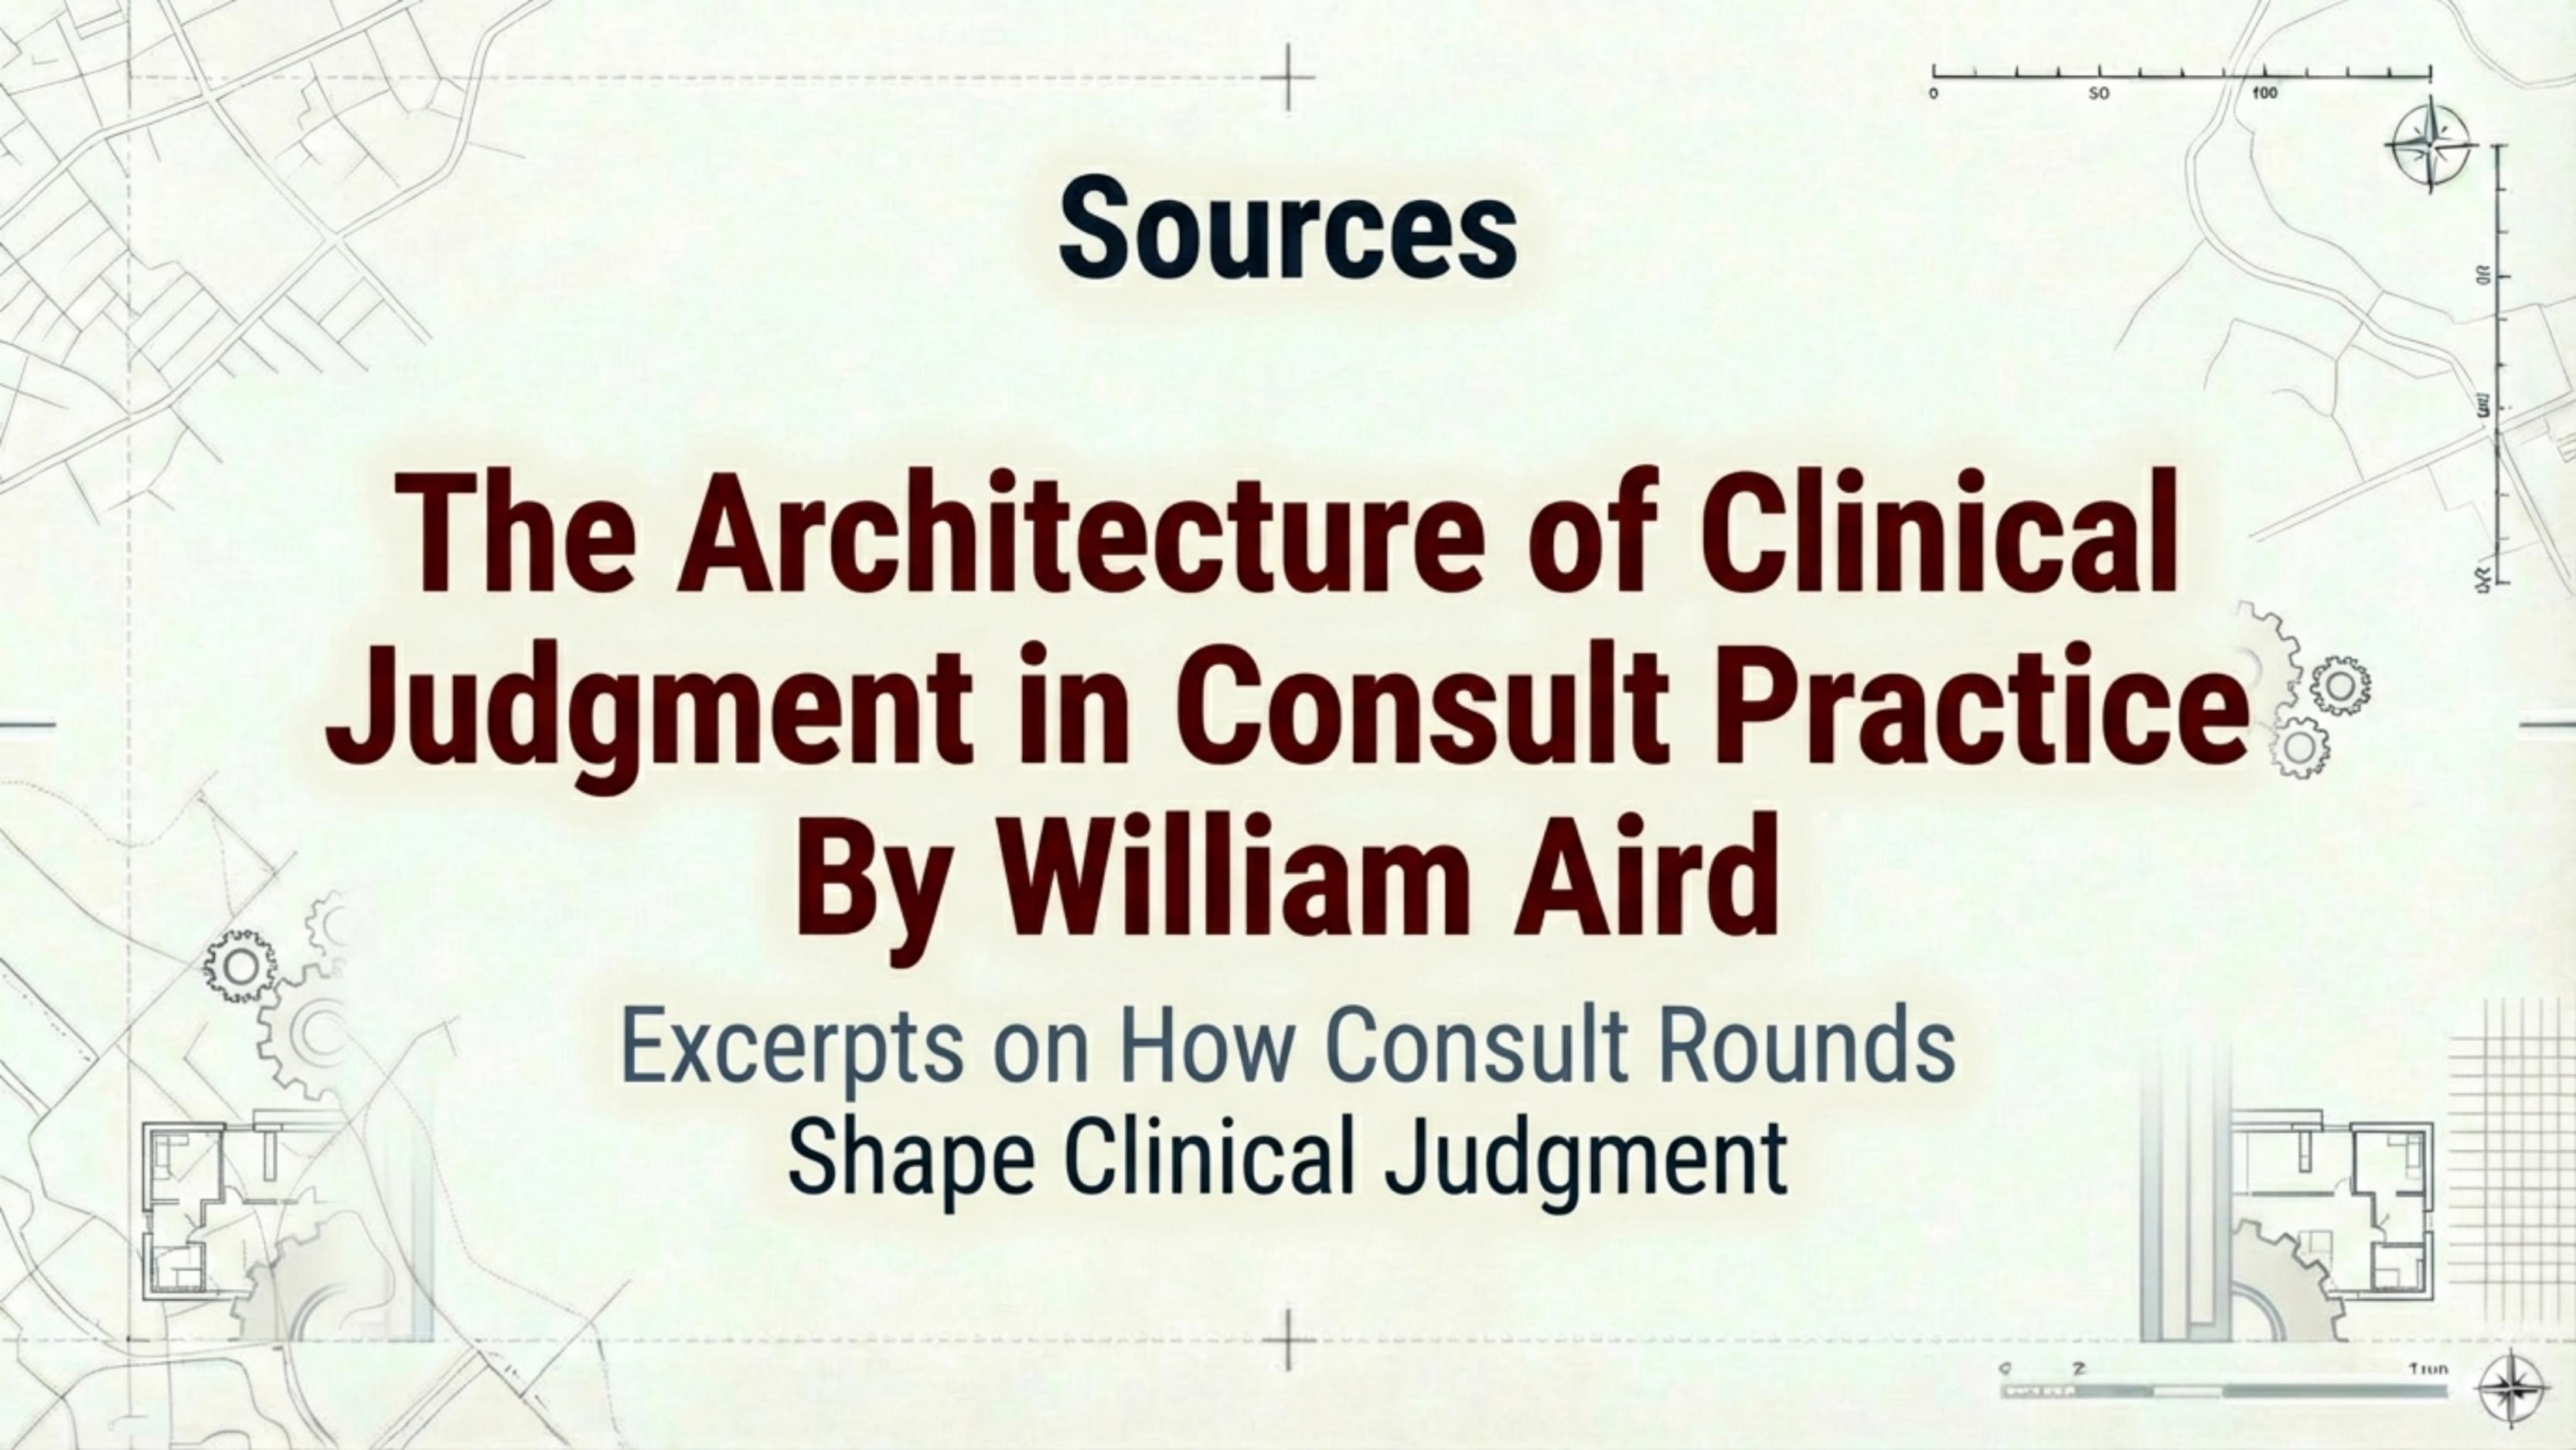

**Culture** Does deference silence safety? (Social Environment)

# Designing with Intention

“How you round teaches what kind of doctor you are training...  
Once we recognize rounding as **cognitive architecture**, we gain the ability to **design it with intention**.”

We cannot escape structure, but we can **choose it**.  
Stop inheriting workflows blindly and start **designing for cognitive safety**.
